

Sample Question for the Fall 2021 Cycle Cognitive/Engineering Reading List

Embodied cognition has been proposed as a radical departure for Experimental Psychology, and Cognitive Science in particular. What is embodied cognition? Please review a minimum of two cognitive and/or engineering domains from the core theory/review articles and evaluate the merits of taking an embodied approach to these areas. Lastly, please design an experiment in which you test whether embodiment can explain a phenomenon of your choosing within one of those areas. Please format your answer as a literature review followed by a proposed method section, including all of the standard details you would find in an empirical method section.
